Environmental
Hazardous Waste Management Branch

Dear Ms. Brooks:

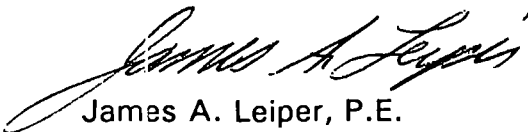

Enclosed are the most recent laboratory analytical results for sample obtained from surface water points in the vicinity of the Souther States Landfill located at 13 Collins Road in Atlanta, Georgia. The surface water sampling points for which results are enclosed consist of SWA-1, which is located upstream of the landfill in the Chattahoochee River and SWA-2, which is located in the discharge from the sediment pond serving the majority of the landfill area.

Analytical results have been enclosed for both the March and June, 1992 sampling events. The reason results from both sampling events are enclosed is that the discharge from the sediment pond was dry during the June, 1992 sampling event.

Examinations of the results indicates that carbon tetrachloride was detected in sample obtained from the sediment pond discharge during the March, 1992 sampling event. The analytical results from the blank associated with this sampling event also shows carbon tetrachloride being detected at a concentration higher than that detected in the sediment pond discharge. This indicates that there is a high degree of doubt as to the actual presence of carbon tetrachloride in the sediment pond discharge.

If you have any questions or comments, or require additional information, please contact me at (404) 953-0608.

Sincerely,

James A. Leiper, P.E.
Regional Engineer
